“Nursing care in patients with social isolation: withdrawal”

Xii– 5 tables – 6 attachments

Background : Social isolation is a person's inability to have a close relationship and is not open to someone, where the individual experiences a decrease in interacting. Based on the results of data from mental disorders in Indonesia in 2018 added. BHSP is a way of approaching clients so that there is mutual trust so that when the approach is easier. The purpose of BHSP is to make patients with mental disorders feel comfortable with nurses, and create a sense of trust in nurses. **Objectives:** To determine the description of nursing care for social interaction disorders; social isolation with a focus on building trusting relationships. **Method:** Descriptive method serves to make a systematic, real and precise description of the facts, and the nature of the population of a place and are taken into several samples. **Results:** During nursing care for 7 days on Mr. A found that Mr. A was willing to introduce himself even though he was asked to and the BHSP problem had been resolved and seemed happy. And obtained an evaluation analysis with the criteria of partially resolved social isolation problems. **Conclusion :** BHSP is not easy for someone because it takes time for mutual trust to arise. Feelings of worthlessness make it more difficult for clients to develop relationships with others. As a result, the client regresses or retreats, experiences a decrease in activity and lacks attention to self-care performance.

Keywords: Nursing Care, Social Isolation.
